Validation of the User Login

This is a Servlet based web application that gives a login page and validates the login details given by the user.

The expected username and password is hard-coded in the program. If the user input the correct username and password on successful login, the user will go to the dashboard.

In the dashboard there will be a link to logout provided, that will take back user to the login page.

If the user inputs wrong username or password, it will be rediercted to an error page that will show an error message, error page will give a link to try again, which goes back to the login page.

The application is built using Eclipse IDE, Apache Tomcat as the web server, HTML pages for the front end, Servlets for backend processing.

The data flow diagram of the application is given below:
